

Bivalirudin for Heparin induced Thrombocytopenia (HIT)

Areas where Protocol/Guideline applicable	SESLHD Inpatients
Relevant Information	SESLHDGL/123 : Heparin Induced Thrombocytopenia – Diagnosis and Management is also available.
Authorised Prescribers:	Haematologists or Medical Officers under the direct supervision of a Haematologist
Indication for use	Heparin induced thrombocytopenia (HIT)
Clinical condition Patient selection: Inclusion criteria (list investigations necessary and relevant results)	<p>Patients with HITT as diagnosed in consultation with a treating haematologist, based initially on clinical scoring (e.g. 4T score), which may be complemented via laboratory testing as time permits.</p> <p>This drug is most likely to benefit patients with HITT fulfilling the following criteria, and would be considered a first line therapy in these indications:</p> <ol style="list-style-type: none"> 1. Undergoing percutaneous coronary or vascular intervention OR 2. Likely to require invasive procedures OR 3. Renal or Hepatic Failure OR 4. Deemed at high risk of bleeding. 5. Suspected COVID-19 Vaccine Induced Thrombocytopenia with Thrombosis
Proposed Place in Therapy State whether drug to be used as first, second or third line. When not first line, describe therapies to be used first. (Consider using algorithm)	For patients not fulfilling one of these criteria, Bivalirudin would be a second line therapy only to be used if there is clear treatment failure with an alternative agent such as Fondaparinux, Danaparoid or a DOAC.
Contra-indications	<ul style="list-style-type: none"> • Patients with active bleeding or increased risk of bleeding because of haemostasis disorders and/or irreversible coagulation disorders. • Severe uncontrolled hypertension or increased risk of severe uncontrolled hypertension • Subacute bacterial endocarditis • Hypersensitivity to bivalirudin or its components
Precautions	<ul style="list-style-type: none"> • Haemorrhage – Can occur at any site. An unexplained fall in blood pressure or haematocrit, or any unexplained symptom, should lead to serious consideration of a haemorrhagic event and cessation of bivalirudin administration. • Renal Insufficiency – Clearance may be reduced in patients with renal impairment, dose adjustments necessary.
Important Drug	Other anticoagulants.

Bivalirudin for Heparin induced Thrombocytopenia (HIT)

Interactions		Prolongs INR will need specific consultation with haematologist when transitioning to warfarin.			
Dosage		Initial dosing			
Weight (kg)	Infusion volume rate (mL/hour) using Bivalirudin 250 mg in 50 mL sodium chloride 0.9%				
	Concentration 5 mg / mL				
	PERIPHERAL LINE				
	CrCl > 60 mL/min 0.15 mg/kg/hr	CrCl 30 – 60 mL/min 0.08 mg/kg/hr	CrCl < 30 mL/min 0.05 mg/kg/hr	Patients receiving Continuous Renal Replacement Therapy (CRRT) 0.05 mg/kg/hr	Patients Receiving Slow Low Efficiency Daily Dialysis (SLEDD) 0.075 mg/kg/hr
40	1.2	0.6	0.4	0.4	0.6
45	1.4	0.7	0.5	0.5	0.7
50	1.5	0.8	0.5	0.5	0.8
55	1.7	0.9	0.6	0.6	0.8
60	1.8	1.0	0.6	0.6	0.9
65	2.0	1.0	0.7	0.7	1.0
70	2.1	1.1	0.7	0.7	1.1
75	2.3	1.2	0.8	0.8	1.1
80	2.4	1.3	0.8	0.8	1.2
85	2.6	1.4	0.9	0.9	1.3
90	2.7	1.4	0.9	0.9	1.4
95	2.9	1.5	1.0	1.0	1.4
100	3	1.6	1.0	1.0	1.5
105	3.2	1.7	1.1	1.1	1.6
110 (maximum)	3.3	1.8	1.1	1.1	1.7
Duration of therapy		Patient dependent, until platelet recovery and / or able to be safely transitioned to warfarin or a separate non intravenous non heparin anticoagulant			

Bivalirudin for Heparin induced Thrombocytopenia (HIT)

<p>Prescribing Instructions</p>	<p>Prescribe in eFluids.</p> <table border="1" data-bbox="499 367 1426 956"> <thead> <tr> <th>Medications</th> <th>14/11/2022 12:37</th> </tr> </thead> <tbody> <tr> <td>Continuous Infusions</td> <td></td> </tr> <tr> <td>Heparin induced thrombocytopenia - 1</td> <td></td> </tr> <tr> <td> bivalirudin additive 250 mg Sodium Chloride 0.9% intravenous solution 50 mL 50 mL, IV Continuous Infusion, 2.1 mL/hr, 1 bag(s) </td> <td> Pending Not given within 5 days. </td> </tr> <tr> <td>Administration Information</td> <td></td> </tr> <tr> <td>bivalirudin</td> <td></td> </tr> <tr> <td>Sodium Chloride 0.9% intravenous solution</td> <td></td> </tr> <tr> <td> bivalirudin additive 250 mg Sodium Chloride 0.9% intravenous solution 50 mL 50 mL, IV Continuous Infusion, 2.1 mL/hr, 1 bag(s) </td> <td> Pending Not given within 5 days. </td> </tr> <tr> <td>Administration Information</td> <td></td> </tr> <tr> <td>bivalirudin</td> <td></td> </tr> <tr> <td>Sodium Chloride 0.9% intravenous solution</td> <td></td> </tr> </tbody> </table> <p>Each order in eFluids corresponds to one bag only. <p>Administration Instructions</p>	<ul style="list-style-type: none"> • Reconstitute 250 mg vial with 5 mL Water for Injection (swirl to dissolve) • Further dilute reconstituted solution to total 50 mL with Glucose 5% or Sodium chloride 0.9% for final concentration of 5 mg/mL • Dose should be based on actual body weight (kg) up to a maximum of 110kg 																						

Bivalirudin for Heparin induced Thrombocytopenia (HIT)

<p>Monitoring requirements</p> <p>Safety</p> <p>Effectiveness (state objective criteria)</p>	<p>A baseline aPTT is required and repeated every 4 hours for the duration of the infusion.</p> <p>Other monitoring: anticoagulation (routinely), FBC (daily), PT (daily).</p> <p>Observe for signs and symptoms of bleeding. If patient actively bleeding, notify medical registrar or haematology registrar / consultant on call immediately.</p> <p>Perform daily urinalysis checking for presence of blood.</p> <p>Bivalirudin infusions must be closely monitored to achieve an aPTT 1.5 to 2.5 times baseline or aPTT 50-80sec.</p> <table border="1" data-bbox="512 741 1513 1155"> <thead> <tr> <th>aPTT</th> <th>Dose Adjustment</th> <th>Calculation</th> <th>Action</th> </tr> </thead> <tbody> <tr> <td>< 50</td> <td>Increase infusion rate by 20%</td> <td>New rate = current rate x 1.2</td> <td>Monitor aPTT every 4 hours</td> </tr> <tr> <td>50 – 80</td> <td>GOAL RATE = NO CHANGE</td> <td>No Change</td> <td>Monitor aPTT every 4 hours</td> </tr> <tr> <td>80 - 100</td> <td>Decrease dose by 10%</td> <td>New rate = current rate x 0.9</td> <td>Monitor aPTT every 4 hours</td> </tr> <tr> <td>> 100</td> <td>Hold infusion for 2 hour, reduce rate at 50% less than previous rate</td> <td>New rate = current rate x 0.5</td> <td>Monitor aPTT every 4 hours</td> </tr> </tbody> </table> <p>Medical officers are responsible for monitoring aPTT. Nursing staff may request a medical officer review when aPTT results become available.</p> <p>Medical officers are responsible for prescribing any rate changes in eFluids. Any future infusion orders, already prescribed, must also be updated each time a rate change is required.</p> <p>Nursing staff MUST document the administration of rate changes in MAR and note when the next aPTT is next due in the Comment box. If no adjustments are required, document this and other details relevant for the infusion in the progress notes. If the infusion has been paused (i.e., rate is 0 mL/hr) for longer than 2 hours, nursing staff to contact the doctor for clarification unless clearly documented.</p> <p>Ensure that the patient has ongoing infusions charted unless Haematology or the treating team has specifically documented or advised to cease the bivalirudin infusion.</p>	aPTT	Dose Adjustment	Calculation	Action	< 50	Increase infusion rate by 20%	New rate = current rate x 1.2	Monitor aPTT every 4 hours	50 – 80	GOAL RATE = NO CHANGE	No Change	Monitor aPTT every 4 hours	80 - 100	Decrease dose by 10%	New rate = current rate x 0.9	Monitor aPTT every 4 hours	> 100	Hold infusion for 2 hour, reduce rate at 50% less than previous rate	New rate = current rate x 0.5	Monitor aPTT every 4 hours
aPTT	Dose Adjustment	Calculation	Action																		
< 50	Increase infusion rate by 20%	New rate = current rate x 1.2	Monitor aPTT every 4 hours																		
50 – 80	GOAL RATE = NO CHANGE	No Change	Monitor aPTT every 4 hours																		
80 - 100	Decrease dose by 10%	New rate = current rate x 0.9	Monitor aPTT every 4 hours																		
> 100	Hold infusion for 2 hour, reduce rate at 50% less than previous rate	New rate = current rate x 0.5	Monitor aPTT every 4 hours																		
<p>Management of Complications</p>	<ul style="list-style-type: none"> • There is no reversal agent for Bivalirudin. • Elimination half-life: 25mins. • Prolonged coagulation times return to normal approximately one hour after discontinuation. • Bivalirudin is cleared by dialysis
