LABELLING OF INJECTABLE MEDICINES, FLUIDS AND LINES

1. AIM
To ensure injectable medicines, fluids and lines are labelled to prevent errors relating to incorrect route, incorrect patient or incorrect dose.

2. PATIENT
This local operating policy applies to all inpatient and outpatient services.

3. STAFF
All health professionals who prepare and/or administer injectable medicines and fluids, including but not limited to:
- Medical Officers
- Nursing Staff
- Midwifery Staff

4. EQUIPMENT
- NIMC
- NSW health fluid chart
- Anaesthetic chart
- Container label
- Line label

5. CLINICAL PRACTICE
All medicines and fluids removed from their original packaging must be identifiable.

All containers (e.g. bags/bottles, syringes, basins, jugs) containing injectable medicines must be labelled using the state standard pre-printed labels which are colour coded to indicate the route of administration.

All lines and catheters for administering injectable medicines must be labelled using the state standard pre-printed labels which are colour coded to indicate the route of administration.

All burettes containing injectable medicines must be labelled using the state standard pre-printed labels which are colour coded to indicate the route of administration.

There is to be no customisation or alteration to the standard NSW Health label set, however additional labelling may be used where required e.g. labelling of medications as cytotoxic; labelling of lines as heparin locked etc. Clarification should be sought from Pharmacy as to whether additional labelling is appropriate or required.

Colour- Coding to Indicate Route of Administration

LABELLING OF INJECTABLE MEDICINES, FLUIDS AND LINES  cont’d

5.1. Labelling of Containers (Bags/Bottles, Syringes and other containers)

General Principles
All bags, bottles or syringes which contain a medicine must be labelled.

Only one medicine should be prepared and labelled at a time. Each injectable medicine drawn up in a bag/bottle or syringe should be prepared and labelled as a single operation by the same person. Labelling must be applied to the container immediately after the medicine is prepared.

Any medicine that is not labelled must be discarded and re-prepared.

Fluid Bags and Bottles
All bags/bottles must be labelled immediately when an injectable medicine is added.

Bag/bottle additive labels should be placed on the front of the bag in a way that ensures that the name of the base fluid, batch number and expiry date remain visible.

Bag/bottle labels are available in 2 sizes. The larger size fits the 500mL - 1 litre bags/bottles, while the smaller label fits the 50mL and 100mL bags/bottles.

Fluid bags and bottles for infusion where no additional injectable medicines are added prior to administration, e.g. intravenous fluids or other pre-mixed and labelled solutions do not require additional labelling.

All premix solutions for pain management where no additional drugs are added must have an appropriate route label (epidural, intravenous) attached indicating patient name, date and time the bag was hung including the two checking clinicians signatures. The colour coded additive label will be used with a line strike through the box for adding drugs and the word premix written.

Syringes
All injectable medicines drawn up in a syringe should be labelled immediately using the state standard pre-printed labels which are colour coded to indicate the route of administration.

Labels should be placed parallel to the long axis of the syringe barrel with the top edge flush with (but not covering) the graduations (refer to Figure 1).

Figure 1: Syringe label

When application of the entire label to the syringe is not possible or practical, apply the label as a “flag” (refer to Figure 2) Smaller syringes used for neonatal infusions will be labelled by using a corner flag.
LABELLING OF INJECTABLE MEDICINES, FLUIDS AND LINES  cont’d

Syringes filled with normal saline to be used as a flush must be labelled with the pre-printed 0.9% sodium chloride label (refer to Appendix 1).

If multiple syringes are required, they should be prepared, labelled and administered sequentially as independent operations. Medications to be administered via different routes must be prepared and administered separately.

Any unlabelled syringe containing a solution must be discarded.

Labelling is required if there is any chance that the syringe will leave the hands of the person preparing the medicine for use prior to administration. This includes placing the syringe in a kidney dish or other receptacle for transport to the patient’s bedside.

Containers on a sterile field
All medicine containers including jugs, basins and syringes on a sterile field which contain medicine should be labelled. Labels used on the sterile field must be sterilised and a sterile marker must be used to complete the label details. Alternatively, pre-printed labels may be used on the sterile field (refer to Appendix 2).

The abbreviated container label may be used where patient identity has been established and other means of recording, labelling and preparation signatories are available (e.g. operating theatres).

Labelling of Lines
All patient lines used for administration of injectable medicines or fluids must be labelled with the state standard pre-printed labels to indicate the route. The labels are colour-coded according to the target tissue.

Labels should be applied near the injection port on the patient side. Labels should be placed so that they do not interfere with the administration of medications through the injection port and do not present an infection risk.

All patient lines not intended for administration of medicines or fluids (such as invasive monitoring lines) must also be labelled to indicate the route.

Administration lines dedicated for continuous infusions of medicines must be labelled to identify the active ingredient in the line using the state standard pre-printed “Medicine” label. Pre-printed sticky-tape labels indicating the drug name may also be used, provided they are colour-coded according to drug class (refer to Appendix 2).
LABELLING OF INJECTABLE MEDICINES, FLUIDS AND LINES  cont’d

Labelling of Locked Catheters
Catheters with a medicine insitu to “Lock” the catheter (e.g. Heparin – lock) must be labelled. The Label must include the active ingredient, date prepared, volume of lumen and final amount of medicine in units. The label must be placed on the catheter, close to the dressing but not impede the function of the dressing.

Labelling of Burettes
Burettes must be labelled immediately after an injectable medicine is added, using the state standard pre-printed label for burettes. This label is designed to be peeled off easily at the completion of the infusion.

Burette labels should be applied fully to the burette (not applied as a flag) and placed so that the text is upright and the burette graduations are not obscured.

5.2. Exemptions:
Labelling is not required when the preparation and bolus administration of a single medicine is one uninterrupted process, the syringe does not leave the hands of the person who prepared it (other than for hand hygiene) and the same person administers the medicine immediately. The ampoule is left in the kidney dish. If there is any interruption in the process the syringe is discarded and it will need to be prepared.
Labelling according to this local operating policy is not required when:
- Bolus medications are prepared in the patient’s home for immediate administration.
- The container (syringe or bag) is commercially prepared and pre-labelled.
- The medicine is prepared for use by Pharmacy and pre-labelled.
- Medicines are drawn up in syringes for use during anaesthesia. Injectable medicines for use during anaesthesia must comply with the Australia/New Zealand Standard which includes colour-coding according to drug class (refer to Appendix 2).

Not exempt
The medicine for immediate use in an emergency situation must be labelled as soon and humanly possible but the injection to the patient may occur first.

Fluid bags and bottles for infusion where no additional injectable medicines are added prior to administration, e.g. intravenous fluids (e.g. 0.9% sodium chloride, 5% glucose), pre-mixed solutions (e.g. potassium, heparin infusions) and peritoneal dialysis fluids DO NOT require additional labelling.

Syringes pre-filled for bolus use or infusion labelled by manufacturer or hospital pharmacy DO NOT require additional labelling.

In all other circumstances, package and sterilise appropriate container/conduit labels for use on the sterile field.
### Conduits

#### Burettes
- The wording “Burette Label for IntraVENOUS Use”
- Patient name (given name and family name)
- Patient ID e.g. URN or MRN
- Active ingredient (medicine) added to burette
- Amount of medicine added (including units)
- Volume of fluid added to the burette (mL)
- Concentration (units/mL)
- Date and time prepared
- Prepared by (signature)
- Checked by (signature)

#### Administration lines
This includes extension lines and giving sets used to deliver fluid and/or medicines into a patient by any parenteral route.
- Route
- Line change due
- Active ingredient (medicine) for dedicated CONTINUOUS infusions

#### Catheters
- Route
- Line change due

#### Invasive monitoring lines
- Route
- Line change due

---

**Burette Label for IntraVENOUS Use**

- Patient name
- Active ingredient (medicine) added to burette
- Amount of medicine added (including units)
- Volume of fluid added to the burette (mL)
- Concentration (units/mL)
- Date
- Prepared by
- Checked by

**Use ‘peel-off’ labels reserved for use on burettes ONLY**
- A new label is required for each medicine administration
- Remove obsolete label before applying new label
- Do not obscure the burette graduations with the label
- Place label so that text is upright

**Subcutaneous**
- Line change due

**Medicine**

**EPIDURAL**
- Line change due

**Intra-ARTERIAL**
- Line change due

**Label near the injection port on the patient side**

**Label near the injection port on the patient side in addition and adjacent to the line route label**

**Label near the port on the patient side**
