

TOPIC	QUESTIONS	KNOWLEDGE (essential in bold)	NOTES
<p>Question 1</p> <p>LOA: 1</p>	<p>1.What factors influence myocardial oxygen consumption?</p> <p>2.How does decreasing a patient’s heart rate improve symptoms of angina?</p>	<p>1. intramyocardial tension which is dependant Pressure –after load, systolic pressure, contractility Radius – preload Wall thickness</p> <p>2. contractile state of the heart ionotropy</p> <p>3. HR ALSO -(cardiac work \propto SV x MAP) Pressure load increases O₂ consumption more than volume load</p> <p>1. decreasing HR decreases O₂ demands 2. at a slower heart rate there is more time for coronary circulation which occurs in diastole</p>	<p>Need bold to pass</p> <p>Prompt: What happens if a patient has tachycardia?</p>
<p>Question 2</p> <p>LOA: 1</p>	<p>(a) Describe the ventilatory response that occurs as you acclimatise to high altitudes.</p> <p>(b) Outline other compensatory responses to high altitudes.</p>	<p>(a) Hyperventilation: Inc altitude – hypoxic stimulation of peripheral chemoreceptors - inc ventilation. Resulting low CO₂ / alkalosis inhibits response; but bicarb shift from CSF and renal excretion bicarb – corrects pH to near normal, allowing further incr ventilation.</p> <p>(b)</p> <ul style="list-style-type: none"> • Moderate altitude – right shift in O₂ dissociation curve (due to incr 2,3 DPG) – dec O₂ affinity to Hb (unload O₂ at tissues); Higher altitude – left shift O₂ dissociation curve (due to decr CO₂) – incr O₂ affinity to Hb (load O₂ in lungs) • Inc erythropoietin – polycythaemia • Inc mitochondria to facilitate O₂ transport into tissues • Inc cellular oxidative enzymes (cytochrome oxidase) • Inc capillaries in periph tissues • • 	 <p>Source: Barrett KE, Barman SM, Boitano S, Brooks H: Ganong's Review of Medical Physiology, 23rd Edition: http://www.accessmedicine.com Copyright © The McGraw-Hill Companies, Inc. All rights reserved.</p> <p>(a) Bold to pass (b) 2 to pass</p>

<p>Question 3</p> <p>LOA: 1</p>	<p>1) How does vasopressin act on the kidney?</p> <p>2) What hormonal changes occur after drinking a large amount of water?</p>	<p>1) In the collecting duct, ADH binds to G-receptor V2 activates adenylate cyclase ↑ IC c-AMP → migration of IC endosomes H₂O channels (aquaporin-2) inserted into luminal membrane ↑H₂O permeability, with ↑H₂O reabsorption</p> <p>2) Begins about 15 min after ingestion. Maximum in about 45 min. The act of drinking produces a small decrease in ADH (vasopressin) secretion resulting in diuresis. Most of the inhibition is produced by the decrease in plasma osmolality after the water is absorbed.</p>	<p>Need bold to pass</p>
<p>Question 4</p> <p>LOA: 2</p>	<p>1) What factors determine the plasma glucose level?</p> <p>2) Explain how the blood glucose is maintained during fasting.</p>	<p>Dietary intake Rate of entry into cells (Muscle, adipose tissue, other organs) Glucostatic activity in liver fasting Liver glycogen broken down-glucose released into bloodstream. Prolonged fasting Glycogen depleted – increase gluconeogenesis from glycerol and amino acids in liver</p>	<p>2/3 to pass</p> <p>2/2 to pass</p>
<p>Question 5</p> <p>LOA: 1</p>	<p>1) What happens to acetylcholine when released into a synapse?</p> <p>2) Describe the differences between the two types of acetylcholine receptors.</p>	<ul style="list-style-type: none"> • Binds to post-synaptic cholinergic receptors • Catabolism by acetylcholinesterase at the postsynaptic membrane • Reuptake of choline • No acetylcholine reuptake • Catabolism by pseudocholinesterase in the circulation <ul style="list-style-type: none"> • Divided on basis of pharmacological properties into muscarinic and nicotinic • Muscarinic–actions mimicked by muscarine and blocked by atropine. Found in smooth muscle, glands and brain. G-protein coupled to adenylyl cyclase and/or phospholipase. • Nicotinic–actions mimicked by nicotine. Found in neuromuscular junction, autonomic ganglia and the central nervous system. Ligand-gated sodium ion channels. 	<p>3/5 to pass</p> <p>Necessary to pass</p> <p>Two sites to pass</p> <p>Two sites to pass</p>

TOPIC	QUESTIONS	KNOWLEDGE (essential in bold)	NOTES
<p>Question 1</p> <p>LOA: 1</p>	<p>Describe the factors that control blood flow to the myocardium</p>	<p>a. Local factors control radius of blood vessels (overall flow and regional flow) Hypoxia – vasodilatation (? mediated via adenosine) Hypoxia is the main factor controlling flow (NB , extraction ratio of about 70%) NO₂ – vasodilatation Local metabolites e.g. -K⁺, adenosine,CO₂, lactate, PG</p> <p>b. Neurogenic factors controlling radius of blood vessels (overall flow and regional flow) Parasympathetic nerves Sympathetic nerves α – vasoconstriction, β vasodilatation Circulating catecholamine’s</p> <p>c. Pressure differences Flow is dependant gradient between arteries and veins OR external compression from muscles. During systole ventricular muscle pressure limits flow especially to subendocardium of the left ventricle</p> <p>d. Viscosity of the blood</p>	<p>Need bold and 1 example of each to pass</p>
<p>Question 2</p> <p>LOA: 1</p>	<p>Outline the metabolic functions of the lung.</p>	<ol style="list-style-type: none"> 1. Synthetic function: synthesis of phospholipids such as dipalmitoyl phosphatidyl choline (surfactant), protein synthesis (collagen & elastin), carbohydrates - mucopolysaccharides of mucous 2. Activation of Angiotensin I to II. 3. Inactivates bradykinin, serotonin, PGE₁, PGE₂ and PGF_{2a}, noradrenaline (30%) 4. Remove leukotrienes (e.g. SRS-A) 5. Secrete IgA 	<p>Prompt:</p> <ol style="list-style-type: none"> 1. What substances can the lung produce? 2. What substances can the lung activate or inactivate? <p>Bold to pass</p>
<p>Question 3</p> <p>LOA: 1</p>	<p>1) Describe the differences between the ascending and descending loops of Henle.</p>	<p>1) Descending – thin cells; permeable to water, due to the presence of aquaporin-1 in both the apical and basolateral membrane. Ascending- proximal (thin): as above</p>	<p>Prompt: differences in structure and function</p>

	2) Describe the changes in the tonicity of tubular fluid as it moves along the loop of Henle.	<p>Ascending - distal (thick): thick cells containing many mitochondria; impermeable to water; co-transport of Na⁺, K⁺, Cl⁻ out of lumen into interstitium.</p> <p>2) Fluid in the descending limb of the loop of Henle becomes hypertonic as water moves out of the tubule into the hypertonic interstitium. In the ascending limb it becomes more dilute because of the movement of Na⁺ and Cl⁻ out of the tubular lumen. When fluid reaches the top of the ascending limb (the diluting segment) it is now hypotonic to plasma.</p>	<p>a) Bold to pass</p> <p>b) Need to describe the changes in tonicity.</p>
Question 4 LOA: 1	<p>1) Outline the biosynthesis of adrenaline.</p> <p>2) How is the action of noradrenaline terminated?</p>	<p>Tyrosine-tyrosine <i>hydroxylase</i> – DOPA (dihydroxy-phenylalanine)-amino acid <i>decarboxylase</i>- Dopamine-dopamine <i>hydroxylase</i>- Noradrenaline- phenylethanolamine <i>methyltransferase</i> Adrenaline</p> <p>a) reuptake presynaptic neuron than metabolised by MAO to inactive deaminated derivatives or recycled</p> <p>b) catabolised synaptic cleft by COMT (catechol methyltransferase) to Normetanephrine</p>	<p>Bold to pass</p> <p>Prompt: How is adrenaline synthesised from tyrosine?</p> <p>Bold to pass</p>
Question 5 LOA: 2	<p>1) Describe the role of parathyroid hormone in calcium metabolism.</p> <p>2) How is parathyroid hormone secretion regulated?</p>	<ul style="list-style-type: none"> • Directly increases bone resorption and mobilises Ca²⁺ causing increased serum calcium. • Directly increases Ca²⁺ reabsorption by the distal renal tubules although increased filtered Ca²⁺ may cause increased excretion. • Indirectly increases gut absorption of Ca²⁺ by increasing formation of 1,25-dihydrocholecalciferol. • Serum Ca²⁺ exerts negative feedback on PTH secretion via a membrane Ca²⁺ receptor. • Serum PO₄²⁻ exerts negative feedback on PTH secretion by decreasing Ca²⁺ and via a membrane Ca²⁺ receptor. • 1,25-dihydrocholecalciferol acts to decrease preproPTH mRNA. • Increased phosphate increases PTH by decreasing Ca²⁺ and 1,25-dihydrocholecalciferol. • Mg²⁺ is required for PTH secretion. 	<p>2/3 bullet points to pass</p> <p>Three of five bulleted points to pass</p>

TOPIC	QUESTIONS	KNOWLEDGE (essential in bold)	NOTES
<p>Question 1: LOA: 1</p>	<p>1)What factors determine cerebral blood flow? 2)What is the Monro-Kellie Doctrine?</p>	<p>1) Intracranial Pressure 2) Local Constriction and dilation of cerebral arterioles 3) Mean Arterial pressure 4) Viscosity of Blood 5) Mean Venous pressure at brain level</p> <p>Volume of blood (75ml), CSF (75ml) and brain (1400g) in the cranium at any time remains relatively constant within a rigid structure.</p>	<p>Bold + 1 other to pass To pass: stating the above without the volumes / weights for a normal person</p>
<p>Question 2 LOA: 1</p>	<p>(a) Describe the function of the central chemoreceptors in the regulation of ventilation. (b) Describe the function of the peripheral chemoreceptors in the regulation of ventilation.</p>	<p>Chemoreceptors – respond to changes in chemical composition in blood or fluid around them (a) Central chemoreceptors - situated in the ventral surface of the medulla, regulates ventilation in response to CSF pH (CO₂ in blood changes pH in CSF – incr CO₂ -> incr H⁺ in CSF -> incr ventilation). (a) Peripheral chemoreceptors – located in the carotid & aortic bodies. They contain glomus cells with high conc dopamine, high blood flow. Respond to a dec in PaO₂ and pH, inc in PaCO₂. Responsible for all the inc ventilation in hypoxia - max response occurs PaO₂<50 mm Hg. Also rapid response to sudden changes in PaCO₂, while carotid body responds to a fall in pH.</p>	<p>Adequate description of function for (a) and (b) - bold</p>
<p>Question 3 LOA: 1</p>	<p>How does the kidney handle potassium?</p>	<p>Potassium is filtered, reabsorbed and secreted</p> <p>Per 24 hours</p> <ul style="list-style-type: none"> ■ 600 mmol filtered ■ 560 mmol actively reabsorbed mainly in PCT (65%) but also 25% in TALLOH (NaK₂Cl co-transporter) and in CD ■ 50 mmol secreted by late DCT and cortical CT cells proportional to flow via Principal Cells ■ With high/low potassium intakes the required extra secretion of K⁺ achieved by increased/decreased secretion in DCT/cortical CT; with extremely low K⁺ intake, there can be net reabsorption of K⁺ in DCT/cortical CT ■ 90 mmol excreted 	<p>Need bold to pass</p>

<p>Question 4 LOA: 2</p>	<p>Q1. What factors are involved in regulating thyroid hormone secretion?</p> <p>Q2. What else affects TSH secretion?</p>	<p>Predominant factor controlling thyroid secretion is the circulating level of TSH released from the anterior pituitary.</p> <p>TRH from hypothalamus serves to increase TSH secretion.</p> <p>Important point – negative feedback loop – whereby circulating T4 and T3 block the increase in TSH secretion produced by TRH. Thyroid hormones inhibit TSH secretion before they inhibit synthesis. T3 – principal feedback regulator of TSH secretion.</p> <p>Other inhibitors of TSH secretion Stress Warmth (in exp animals) Dopamine, somatostatin and glucocorticoids (but physiological role in regulation of TSH secretion is not known)</p> <p>Cold – stimulates TSH secretion (exp animals and human infants)</p>	<p>Pass criteria – LOA 2 Bold to pass</p> <p>2 to pass</p>
<p>Question 5 LOA: 1</p>	<p>1. Describe the resting membrane potential of a cell.</p> <p>2. What conditions are required to create a resting membrane potential?</p> <p>3. In a neuron what ions are involved and how is the concentration gradient produced?</p>	<p>There is difference in electronic charge across a cell membrane. The inside is negative compared to the outside. Resting MP results from separation of positive and negative charges across a cell membrane. Neuron average RMP -70 mV.</p> <p>Lipid bilayer, unequal distribution of ions, membrane must be permeable to ions, concentration gradient.</p> <p>Na and K. Na is primarily extracellular and K intracellular. Passive movement of ions occur via selective ion channels. Na-K ATPase actively move ions against their electrochemical gradient.</p>	<p>Bold to pass</p> <p>2 out 4</p> <p>Bold to pass.</p>
