## FLUIDS

## TBW

~60\% body weight

ICF
2/3 total body water

## ECF $1 / 3$ total body water

Intravascular Fluid $1 / 4$ ECF ~8\% total body water

Interstitial Fluid 3/4 ECF ~25\% total body water

Table 21-1 Electrolyte Concentrations of Fluids (mEq/L)

| Solution | Plasma | Interstitial | Intracellular | Normal Saline | Lactated Ringer's Solution |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Cations |  |  |  |  |  |
| Sodium | 142 | 144 | 10 | 154 | 130 |
| Potassium | 4 | 4.5 | 150 | - | 4 |
| Magnesium | 2 | 1 | 40 | - | - |
| Calcium | 5 | 2.5 | - | - | 3 |
| Total cations | 153 | 152 | 200 | 154 | 137 |
| Anions |  |  |  |  |  |
| Chloride | 104 | 113 | - | 154 | 109 |
| Lactate | - | - | - | - | 28 |
| Phosphates | 2 | 2 | 120 | - | - |
| Sulfates | 1 | 1 | 30 | - | - |
| Bicarbonate | 27 | 30 | 10 | - | - |
| Protein | 13 | 1 | 40 | - | - |
| Organic acids | 6 | 5 | - | - | 137 |
| Total anions | 153 | 152 | 200 | 154 |  |

## Solutes.

- $1 \mathrm{Eq}=$ Mass of 1 mol of a substance (in grams) divided by its charge.
- 1 Eq of $\mathrm{Na}^{+}=23$ grams, whereas 1 mol of $\mathrm{Ca}^{+}=40 \mathrm{grams} / 2=20 \mathrm{grams}$
$\cdot \therefore 1 \mathrm{~mol}$ of $\mathrm{Na}^{+}=1 \mathrm{Eq}$ of $\mathrm{Na}^{+}$, whereas 1 mol of $\mathrm{Ca}^{+}=2 \mathrm{Eq}$ of $\mathrm{Ca}^{+}$!
- Osmole = Amount of substance (in moles) that dissociates to form 1 mol of osmotically active particular.
- eg. $0.5 \mathrm{~mol} \mathrm{NaCl} \rightarrow 0.5 \mathrm{~mol}$ of both $\mathrm{Na}^{+} \& \mathrm{Cl}^{-}$in soln. $\rightarrow 1$ osmole !!
- Osmolarity $=2 x[\mathrm{Na}+]+$ glucose + urea + ethanol
- $2 x\left[\mathrm{Na}^{+}\right]$estimates $\mathrm{Na}^{+}+\mathrm{Cl}^{-}+\mathrm{HCO}^{-}$
- Normally 275-295 mOsm/L
- Normal Osmolar Gap $=\sim 10$.

## Homeostasis.

- Average normal adult requires;
- 2000-3000mL of $\mathrm{H}_{2} \mathrm{O}$ per day.
