BUDESONIDE

DESCRIPTION
Inhaled steroid with strong glucocorticoid and negligible mineralocorticoid activity. Budesonide has local anti-inflammatory effects with low systemic corticosteroid side effects over a wide dose range. Cochrane Reviews of inhaled vs systemic steroid use in ventilator-dependent preterm infants have not shown significant evidence of short or long-term benefit or advantage over systemic steroids.

USE
Severe chronic lung disease

PRESENTATION
0.5mg/2ml Respules for nebulisation

PHARMACOKINETICS
First-pass metabolism in the liver after systemic absorption. A proportion of the drug may be swallowed. The percentage of the inhaled dose reaching the lung will depend upon the method and delivery of the nebulised budesonide. After a single dose, improvement of the lung function is achieved within a few hours. The duration of effect is more than 12 hours. Full effect is not achieved until after a couple of days.

DOSE
500mcg Respules twice daily via nebuliser

ADMINISTRATION
Inhaled via spacer device (aerochamber) or nebulizer.

ADVERSE EFFECTS
1. mild irritation in the throat
2. candida infection in the oropharynx
3. facial skin irritation
4. bronchoconstriction (rare)
5. gastrointestinal (nausea and vomiting)
6. suppression of the pituitary-adrenal axis
7. posterior subcapsular cataracts

PRECAUTION
1. Known sensitivity to budesonide
2. Caution neonates with fungal and viral infections in the airways
3. Caution neonates who are being transferred from oral corticosteroids to budesonide
4. Caution, may need to wean dose, do not stop suddenly

DRUG INTERACTION
After oral administration of ketoconazole, a potent inhibitor of CYP3A4, the mean plasma concentration of orally administered budesonide increased. Concomitant administration of other known inhibitors of CYP3A4 (eg, itraconazole, clarithromycin, erythromycin, etc.) may inhibit the metabolism of, and increase the systemic exposure to budesonide. Care should be exercised when budesonide is coadministered with long-term ketoconazole and other known CYP3A4 inhibitors. Omeprazole did not have effects on the pharmacokinetics of oral budesonide, while cimetidine, primarily an inhibitor of CYP1A2, caused a slight decrease in budesonide clearance and a corresponding increase in its oral bioavailability.
