SUXAMETHONIUM CHLORIDE

Intubation, suction and ventilation equipment MUST be ready prior to administration of suxamethonium. A medical officer/nurse practitioner (preferably two personnel) experienced in advanced neonatal airway management techniques should be present of the medication is being administered. Risk of cardiac arrest from hyperkalemic rhabdomyolysis. There are two preparations. Chloride anhydrous salt (SAS product) equates to 110mg in 2 mL of suxamethonium chloride which is 10% more suxamethonium than suxamethonium chloride dihydrate sequence (Australian TGA registered product)	alt at

Chloride anhydrous salt (SAS product) equates to 110mg in 2 mL of suxamethonium chloride which is 10% more suxamethonium than suxamethonium chloride dihydrate s (Australian TGA registered product) Indication Elective endotracheal intubation. Action Short-acting, depolarising neuromuscular blocker. It acts as an acetylcholine antagonist nicotinic acetylcholine receptors at neuromuscular junctions, resulting in persistent depolarisation of the motor end plate. Drug Type Neuromuscular blocking agent (depolarising) Trade Name Suxamethonium Chloride (dihydrate) Injection BP, Succinolin Chloride (anhydrous) Injection, MercuryPharma Suxamethonium Chloride (dihydrate) Injection Presentation 100 mg/2 ml ampoule. *See "Alert" section above to account for brand difference. Dosage/Interval IV (preferred): 2 mg/kg (up to 3 mg/kg) IM (only if IV is not accessible): 3–4 mg/kg ⁹ (onset of action can be delayed up to 3 mir and duration of action is up to 15 minutes) Therapeutic hypothermia: No information on the dose adjustment, but has been used. ECMO: Not applicable.	alt

ECMO: Not applicable.	
Renaring an include with caution as use associated with hyperkalaema.	
Hepatic impairment: may prolong duration of action. Avoid repeated doses.	
Route IV, IM	
Maximum Dose IV: 3 mg/kg/dose; IM: 4 mg/kg/dose	
Preparation IV:*	
Draw up 2 mL (100 mg of suxamethonium) and add 8 mL sodium chloride 0.9% to make	<u> </u>
final volume 10 mL with a concentration of 10 mg/mL.	
*Dilution for both dibudgets and orbudgets is look the same as the difference is	
*Dilution for both dihydrate and anhydrous salts is kept the same as the difference is insignificant.	
magnineant.	
IM: Administer undiluted.	
Administration IV: Rapid injection at proximal cannula site.	
IM: Administer in anterior thigh muscle.	
Monitoring Continuous cardiorespiratory monitoring. Monitor temperature, blood pressure,	
oxygenation and assisted ventilator status.	
Contraindications Hyperkalaemia	
Family history of malignant hyperthermia	
Skeletal muscle myopathy	
Hypersensitivity to suxamethonium	
Precautions Anaphylaxis: Severe anaphylactic reactions (some life-threatening and fatal) have been	
reported. Cross-sensitivity with other neuromuscular-blocking agents may occur; use	
extreme caution in patients with previous anaphylactic reactions. Bradycardia: May increase vagal tone. Risk of bradycardia may be increased with secon	Ч
dose and may occur more often in children. Occurrence may be reduced by pre-treatin	
with anticholinergic agents (e.g. atropine).	•
May Increase intraocular pressure.	
May cause a transient increase in intracranial pressure.	
May increase intragastric pressure, which could result in regurgitation and possible	
aspiration of stomach contents.	
· ·	
Malignant hyperthermia: Use may be associated with acute onset of malignant

SUXAMETHONIUM CHLORIDE

Drug Interactions	May enhance the effect of other agents with neuromuscular-blocking properties: acetylcholinesterase inhibitors; magnesium, quinidine, quinine, vancomycin,
	acetylcholinesterase inhibitors; magnesium, quinidine, quinine, vancomycin,
	cyclophosphamide monohydrate, ciclosporin, esmolol, lincosamide, loop diuretics.
	Aminoglycosides: May enhance the respiratory depressant effect of aminoglycosides.
	Opioid analgesics: Suxamethonium may enhance the bradycardic effect of opioid
	analgesics.
	Cardiac glycosides: May enhance the arrhythmogenic effect of cardiac glycosides
Adverse Reactions	Bradycardia is common in neonates and children, especially after a second dose of
	suxamethonium. May be prevented by administration of atropine prior to administration of
	suxamethonium.
	Hyperkalaemia
	Prolonged paralysis in infants with deficiency of pseudocholinesterase.
	Hypersensitivity reactions
	Malignant hyperthermia
	Management of suxamethonium overdose and/or toxicity is supportive.
Compatibility	Dextrose 5%, dextrose 10%, sodium chloride 0.9%, dextrose 5% in sodium chloride 0.9%,
. ,	dextrose 5% in sodium chloride 0.45%, sodium chloride 0.45%.
	Y-site administration: potassium chloride, propofol, vitamin B complex with C.
Incompatibility	Y site administration: Amino acid solution, lipid emulsion, heparin, alkaline solutions with
	pH > 8.5.
Stability	Suxamethonium Chloride (dihydrate) Injection BP brand: once removed from fridge, is
J. Carlotte	stable below 25 °C for 1 month only. Discard any unused product after that time, do not
	return to the fridge.
	Infusion solution: use within 24 hours
Storage	Refrigeration at 2°C to 8°C. DO NOT FREEZE.
Juliage	For Succinolin and MercuryPharma brands: protect from light.
Special Comments	Poorly absorbed from gastrointestinal tract – must be given IM or IV.
Special Comments	Rapidly and completely hydrolysed by hepatic and plasma pseudocholinesterase.
	Very rapid onset (30–60 seconds) and short duration of action (3–5 minutes) with IV
	administration. Continuous administration over a prolonged period of time may result in
	irreversible blockade (phase II block). Should not be used without additional sedation.
Evidence summary	Efficacy
Evidence Summary	Suxamethonium in combination with other drugs (analgesics and vagolytic agents) resulted
	in superior intubation conditions and a shorter procedure duration 1-6. (Level II, Grade A)
	For laparoscopic pyloromyotomy in term infants using propofol, sevoflurane and no
	intraoperative opioid, succinylcholine may be the neuromuscular blocking drug of choice,
	provided no contraindication is present ⁴ . (Level III-3, Grade B)
	Cofety
	Safety
	Suxamethonium has been very widely used, but has several rare side effects and causes an
	increase in blood pressure, simultaneously with depolarisation. ^{1,2} (Level II Grade B)
	Hyperkalaemia may occur, but major elevations are uncommon. It may trigger malignant
	hyperkalaemia, a rare autosomal dominant disorder of skeletal muscles that remain
	asymptomatic unless triggering substances are given. It should not be used in infants with
	resolution occurs in infants with pseudocholinesterase deficiency. ⁷ (Level IV Grade D)
	Pharmacokinetics
	Suxamethonium has a rapid onset of action (30 seconds) and a short duration of action (3
	to 6 minutes) with IV administration. The increased dose (2–3 mg/kg vs. 1 mg/kg in adults)
	requirement of succinylcholine in younger patients is thought to be due to its rapid
	distribution into an enlarged volume of extracellular fluid rather than an altered response
	to the action of the drug at neuromuscular junction nicotinic acetylcholine receptors. ⁸
	(Level III Grade C)
	hyperkalaemia or family history of malignant hyperthermia.¹ (Level IV Grade D) It can cause prolonged neuromuscular blockade requiring ventilation until spontaneous resolution occurs in infants with pseudocholinesterase deficiency. ⁷ (Level IV Grade D) Pharmacokinetics Suxamethonium has a rapid onset of action (30 seconds) and a short duration of action (3
