### Alprostadil (Prostaglandin E₁)

**Newborn use only**

**Alert**
1 microgram = 1000 nanograms.

**Indication**
For temporary maintenance of ductus arteriosus patency until corrective or palliative surgery can be performed in neonates with ductal-dependent congenital heart defects.

**Action**
Relaxes the ductus arteriosus in early postnatal life and supports its patency.

**Drug Type**
Prostaglandin E₁ or PGE₁

**Trade Name**
Prostin VR.

**Presentation**
Ampoules (sterile solution) 500 microgram/mL 1 mL

---

### Dosage / Interval

<table>
<thead>
<tr>
<th>Starting Dose</th>
<th>Dose: 10 nanogram/kg/minute (range: 5 to 50 nanogram/kg/minute).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>For known congenital heart disease patients and prior to ductal closure: Start at 10 nanogram/kg/min.</td>
</tr>
<tr>
<td></td>
<td>If there is no clinical or echocardiographic response to the maximum dose of 50 nanogram/kg/min, then consult a paediatric cardiologist. Very rarely they may suggest a very short trial of up to 100 nanogram/kg/min.</td>
</tr>
</tbody>
</table>

**Maintenance Dose**
3-20 nanogram/kg/minute. Aim is to be on the lowest dose that safely maintains ductal patency.

**Maximum dose**
Higher doses ≥50 nanogram/kg/minute may be needed to resuscitate infants with poor perfusion and oxygenation (‘grey baby’) and with ductal closure in suspected duct-dependent congenital heart disease.

**Route**
Continuous IV infusion.

### Preparation/Dilution

#### LOW concentration continuous IV infusion [use if attempting to avoid ventilation and keep ductus open]

<table>
<thead>
<tr>
<th>Infusion strength</th>
<th>Prescribed amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 mL/hour = 10 nanogram/kg/minute</td>
<td>30 microgram/kg alprostadil (Prostin VR, PGE₁) and make up to 50 mL</td>
</tr>
</tbody>
</table>

First dilution: Draw up 1 mL (500 microgram) of alprostadil and add 9 mL of sodium chloride 0.9% or glucose 5% to make a final volume of 10 mL with a concentration of 50 microgram/mL.

Second dilution: From this, draw up 0.6 mL/kg (30 microgram/kg) and dilute to 50 mL with sodium chloride 0.9% or glucose 5%. Infuse at rate of 1 mL/h = 10 nanogram/kg/minute.

#### HIGH concentration continuous IV infusion [consider if ductus closed and/or mechanically ventilated]

<table>
<thead>
<tr>
<th>Infusion strength</th>
<th>Prescribed amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 mL/hour = 50 nanogram/kg/minute</td>
<td>150 microgram/kg alprostadil (Prostin VR, PGE₁) and make up to 50 mL</td>
</tr>
</tbody>
</table>

First dilution: Draw up 1 mL (500 microgram of alprostadil) and add 9 mL of sodium chloride 0.9% or glucose 5% to make a final volume of 10 mL with a concentration of 50 microgram/mL.

Second dilution: From this, draw up 3 mL/kg (150 microgram/kg) and dilute to 50 mL with sodium chloride 0.9% or glucose 5%. Infusing at rate of 1 mL/h = 50 nanogram/kg/minute.

---

### Administration
Continuous intravenous infusion. Ensure reliable intravenous access as short half-life.

### Monitoring
Continuous pulse oximetry, heart rate, ECG and blood pressure monitoring.
Assess urine output and peripheral perfusion frequently.

### Contraindications
Ensure adequate cardiorespiratory monitoring and cardiorespiratory resuscitation equipment available for immediate use if necessary.

Apnoea is frequent. Commencement of alprostadil ≤ 20 nanogram/kg/min and low maintenance dose reduces apnoea incidence.

Tritrate to infant’s response (increased oxygenation, echo findings and side effects) - Aim is to be on the lowest dose that safely maintains the ductal patency.

Hyperosmolar – infuse at concentrations < 20 microgram/mL.

---
Neonates with total anomalous pulmonary venous return below the diaphragm – may precipitate pulmonary oedema because of increased pulmonary blood flow.

**Drug Interactions**
Concomitant administration with heparin may result in an increased risk of bleeding.

**Adverse Reactions**
Apnoea is frequent. Commencement of alprostadil ≤ 20 nanogram/kg/min and low maintenance dose reduces apnea incidence. Methylxanthines (caffeine or aminophylline) may be used to prevent or treat apnoea. [4]
May lower blood pressure by relaxing the vascular smooth muscle causing vasodilatation and can elevate body temperature.
Other reported effects include abdominal distension, bradycardia, enterocolitis, vomiting and skin rash. [5]
With prolonged use, skeletal changes [10] and hypertrophic pyloric stenosis [11, 12] have been reported.
Extravasation may cause tissue necrosis.

**Compatibility**
Fluids: Glucose 5%, sodium chloride 0.9%.
Y-site: Amino acid solutions, ampicillin; cefazolin; cefotaxime; chlorothiazide; dobutamine; dopamine; fentanyl; gentamicin; methylprednisolone; nitroprusside; potassium chloride; tobramycin, vancomycin; vecuronium.
Syringe: Caffeine; dobutamine; dopamine; adrenaline (epinephrine); fentanyl; midazolam; morphine.

**Incompatibility**
Y-site: Levofloxacin

**Stability**
Diluted solution stable for up to 24 hours.

**Storage**
Ampoule: Store at 2 to 8°C. Do not freeze.

**Special Comments**
Do not use if cloudy (crystallised).
Undiluted solution (500 microgram/mL) is hyperosmolar. Dilute before administration to a concentration of 20 microgram/mL or less.
