LOCAL OPERATING PROCEDURE

CLINICAL POLICIES, PROCEDURES & GUIDELINES

Approved by Quality & Patient Safety Committee
20/6/13

INTRAVENOUS CANNULA CARE IN POSTNATAL WARDS : NEONATE

1. OPTIMAL OUTCOMES

- Using an aseptic technique to assess patency and manage the neonate's intravenous cannula (IVC)
- Absence of infection at the cannulation site.

2. PATIENT

- Neonates

3. STAFF

- Registered Midwives
- Student Midwives
- Medical staff

4. EQUIPMENT

- Syringe
- 0.5ml 0.9% saline flush
- Alco wipes

5. CLINICAL PRACTICE

- Explain procedure to parents
- Swab connection point of cannula bung prior to use
- Inspect every four hours intravenous cannula site (IVC) for redness, swelling, pain or heat
- Report any of the above signs to paediatric medical officer. DO NOT use cannula until reviewed
- Record temperature respiration and heart rate every four hours
- Confirm patency every 6 hours and prior to intravenous (IV) medication by administration of 0.9% saline flush (1mL is normally prescribed)
- Record flush on the medication chart
- Administer IV antibiotics as per 'RHW Newborn Care Centre - IV Therapy and Drug Administration Protocol'

6. HAZARDS / SUB-OPTIMAL OUTCOMES

- Cannula related infection

7. DOCUMENTATION

- Neonatal clinical pathway
- Neonatal Medication Chart

INTRAVENOUS CANNULA CARE IN POSTNATAL WARDS : NEONATE cont'd

8. EDUCATIONAL NOTES

- Unlike adults IVC are not routinely resited after 72 hours because of the risk of infection
- Care of IVC will avoid multiple cannulation of the baby
- Adhering to infection control principles will minimise the risk of infection to both the cannulation site and the intravascular cannula

9. RELATED POLICIES / PROCEDURES / CLINICAL PRACTICE GUIDELINES

- RHW Newborn Care Centre - IV Therapy and Drug Administration Protocol
- Aseptic Technique
