Alert
The Antimicrobial Stewardship Team recommends this drug is listed under the following category: Unrestricted.

Indication
Treatment of infections caused by susceptible organisms: Gram positive bacteria (Streptococci and Staphylococci including beta-lactamase producing Staphylococci) and gram negative bacteria (Escherichia coli and some Klebsiella species, provided these are reported susceptible to cefazolin).

Action
Bactericidal. Inhibits bacterial wall synthesis of actively dividing cells by binding to one or more penicillin binding proteins.

Drug Type
Antibiotic: First generation cephalosporin.

Trade Name
Cefazolin Sandoz, Cefazolin-AFT, Hospira Cefazolin, Kefzol, Cefazolin alphapharm

Presentation
1 g vial.

Route
IV

Preparation/Dilution
Add 9.5 mL WFI to the 1 g powder for reconstitution to make a concentration of 100 mg/mL. Draw up 1 mL (100 mg) and add 3 mL of sodium chloride 0.9% to make a final volume of 4 mL with a concentration of 25 mg/mL.

Administration
IV injection: Slow injection over 3 to 5 minutes. Maximum concentration 100 mg/mL.
IV infusion: Dilute to 5–20 mg/mL and infuse over 10 to 60 minutes.
IM injection: Dilute to a concentration of 225–330 mg/mL. Inject deep into large muscle mass. Reconstitute with WFI or lignocaine 0.5%

Monitoring
Serum concentrations are not routinely monitored.
Monitor renal function and complete blood count during prolonged (>10 days) and/or high-dose treatment.

Contraindications
History of allergy to cephalosporins, severe or immediate allergic reaction to penicillin or carbapenem.

Precautions
Sodium restriction — each gram of cefazolin contains 48.3 mg (2.1 mmol) sodium. May increase risk of bleeding due to its effect on clotting factors. Impaired renal function: consider reducing dose as seizures may occur if inappropriately high doses are administered.

Drug Interactions
Administration with other drugs, particularly aminoglycosides may increase risk of nephrotoxicity.

Adverse Reactions
Thrombophlebitis, pruritus, rash, diarrhoea, nausea, oral candidiasis, pseudomembranous colitis, vomiting, Stevens Johnson Syndrome, Clostridium difficile colitis, positive Coombs test, eosinophilia, leukopenia, neutropenia, thrombocytopenia, thrombocytosis, blood coagulation disorder, raised liver enzymes, candidiasis, raised urea, creatinine and renal failure.

Compatibility
Fluids: Glucose 5%, glucose 10%, glucose in sodium chloride solutions, Hartmann’s, sodium chloride 0.9%, water for injections.
Compatible via Y-site: Aciclovir, amifostine, anidulafungin, atracurium, aztreonam, bivalirudin, dexmedetomidine, esmolol, filgrastim, fluconazole, foscarnet, granisetron, heparin sodium, linezolid, magnesium sulfate, midazolam, morphine sulfate, palonosetron, pancuronium, pethidine, remifentanil, vecuronium.
### Incompatibility

Fluids: No information

Drugs: Aminoglycosides – amikacin, gentamicin, tobramycin, ascorbic acid, azathioprine, calcium chloride, caspofungin, chlorpromazine, dobutamine, dolasetron, dopamine, erythromycin, ganciclovir, haloperidol lactate, hydralazine, mycophenolate mofetil, pentamidine, promethazine, rocuronium.

### Stability

Stable for 24 hours below 25°C. However store at 2 to 8°C and use as soon as possible. Crystals may form if the solution is refrigerated. Redissolve by shaking the vial and warming in the hands.

### Storage

Store below 25°C. Protect from light.

### Special comments

Poor penetration into cerebrospinal fluid therefore not suitable for infections of the CNS.

Renally excreted as unchanged drug. Not metabolised.

Half-life in neonates is 3 to 5 hours.

Cefazolin is highly bound to serum albumin – only the unbound cefazolin is pharmacologically active.

Water for injection is the preferred diluent. Crystals may form when cefazolin is reconstituted with sodium chloride 0.9% to a concentration of 330 mg/mL. The crystals formed are small and may be overlooked. Redissolve by warming the vial in hands until the solution is clear.

### Evidence summary

The dosing regimen adopted by the consensus group is based on a neonatal pharmacokinetic model taking into account total and unbound cefazolin concentrations with saturable plasma protein binding. A prospective validation of this dosing regimen is needed.
